

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

are not at present in collections enough properly prepared and unworn breeding specimens of *shufeldti* to render a comparison of their characters conclusive.—FRANK M. CHAPMAN, *American Museum of Natural History, New York City.*

Black-throated Bunting (*Spiza americana*) on Long Island, N. Y. — A young male of this species was shot at Blithewood, Long Island, on Aug. 25. The bird was in bad company when it met its fate, for it had joined a flock of English Sparrows in their depredations upon a neighboring oat-field. The specimen is a young male, the black throat indicated only by bounding streaks of that color, and a black tip here and there among the throat feathers.—FRANK E. JOHNSON, *Parkville, Long Island, N. Y.*

Breeding of *Dendroica maculosa* in Western Pennsylvania.—While on a collecting trip in Butler and Armstrong Counties, Pennsylvania, in May, 1889, I had the good fortune to find the Magnolia Warbler nesting. The discovery was made in the narrow valley—they are rarely a hundred feet wide—of one of the brooks emptying into Buffalo Creek, about six miles north of the town of Freeport. On May 30, while rummaging about in a bushy growth of young hemlock saplings, I found a nest placed about three feet from the ground in the midst of one of them. It was made of slender, blackish, dead twigs with fine weed-stems and horsehair for lining. On June 1 the nest contained three eggs, and on the 3d I saw the female on the nest in which now a fourth egg had been laid. She left her place, and though I waited for her to return to it, in order that I might complete the identification by shooting her as she flew from the nest, she refused to do so, and in company with her mate hovered uneasily about until nightfall. On my return early the next morning the female left the nest at my approach, and a moment later lay dead at my feet. Examining her at my leisure, I saw there was no mistake in my identification, and when later I took the precaution to compare the bird with the description in Coues's Key, it agreed in every particular.—W. E. CLYDE TODD, *Beaver, Beaver County, Penn.*

Correction.—In my 'Revised Catalogue of the Birds of Kansas' I described what I then supposed to be the nest and eggs of the Sycamore Warbler (*Dendroica dominica albiflora*). I am now satisfied that the evidence is not reliable upon which the entry was based.

I have met with the birds upon several occasions in the State, during the summer months, on the banks of the Neosho River, and always in or about the large sycamore trees; but I have never been so fortunate as to find their nest, neither can I find any authentic description of their nest and eggs. They undoubtedly nest in the tree tops, like the Eastern bird, *D. dominica*. Information in regard to their nesting habits, etc., is very desirable.—N. S. GOSS, *Topeka, Kansas.*
